Exterior Concrete Maintenance

- At a minimum, exterior concrete should be cleaned yearly, ideally in the spring. Cleaning removes dirt, salt, and grime build-up from the winter months.

- Depending on the level of wear, resealing your concrete surface every 1-2 years to reduce moisture infiltration and stains is recommended.
- Avoid using harsh de-icing chemicals on your concrete driveway since they can cause or contribute to surface damage. If you have issues with traction, consider using sand.

- Repair cracks in concrete to maintain a structurally sound surface and to minimize water intrusion through cracks, which can cause problems with the sub grade.

- We recommend hiring a licensed contractor.
